

## **100% renewables**

We have the technology now to make at least our stationary power supplies 100% renewable by 2025. Any consideration to reduce the RET is a backward step.

We are currently using primitive, finite, power sources that destroy the very place that is our, and many other species' home.

Only when we use completely renewable sources of energy can we have the right to call ourselves truly modern.

The future of our planet should NOT be in the hands of a lobby group (fossil fuel lobby group et al) whose only interest is keeping their jobs and wealth growing no matter the impact on the future of the planet.

Short term gain with long term loss is primitive and no more than greedy.

Fossil fuels ARE finite no matter how many more sources are discovered... it will end at some point. Now is the time to change, while we have time – when there is no more it will be too late.

Changing our way of generating power to one that is 100% renewable is not only sensible and necessary it is ethical.

I call for the RET to be set at 100%
